DOWAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.

SIMILARITY: Belongs to the annexin family.

SIMILARITY: Contains 4 annexin repeats.

                                    FUNCTION: This protein is an anticoagulant protein indirect inhibitor of the thromboplastin-specific is involved in the blood coagulation cascade. DOWAIN: A pair of annexin repeats may form one bir calcium and phospholipid.

SIMILARITY: Belongs to the annexin family.
               SIMILARITY: Belongs to the annexin fami SIMILARITY: Contains 4 annexin repeats.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         C;Comment: Annexins undergo reversible, calcium-dependent binding to C;Comment: Calpactin I, a tetramer of two heavy chains and two light oskeleton and be involved with exocytosis.
C;Comment: Annexin II is the heavy chain component of calpactin I. The C;Comment: Annexin II is the heavy chain component of calpactin I. These ligation is two moles of calcium ion per mole of annexin II. These ligations is the heavy chain component of calpactin I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       J. Biol. Chem. 266, 5169-5176, 1991
A;Title: The protein-tyrosine kinase substrate, calpactin A;Reference number: A23717; MUID:91161611; PMID:1825830

NH2-terminal

A;Title: Association of the S-100-related calpactin I light chain with the A;Reference number: A38844; MUID:86278112; PMID:2942542 A;Contents: annotation, amino-terminal acetylation

derstood Comment: Annexins undergo reversible, calcium-dependent binding to membrane 18 phospholip found in

C;Comment: Calpactin I, a tetramer of two heavy chains and two light chains, oskeleton and be involved with exocytosis.

C;Comment: Annexin II is the heavy chain component of calpactin I. The affinity of annex I I binds two moles of calcium ion per mole of annexin II. These ligands make annexin II C;Comment: Annexin II annexin I as a regulator of intracellular phospholipase activity. C;Superfamily: annexin I; annexin repeat homology C;Keywords: acetylated amino end; actin binding; calcium binding; duplication; endonexin F;2-339/Product: annexin II #status experimental <MAT>
F;2-12/Region: calpactin I light chain binding #status predicted
F;36-107/Domain: annexin repeat homology <AX1>
